Sod Watering Instructions

1. Saturate the area with water immediately. Be sure water has gone through the sod and into your soil beneath.
Note: One gallon of water within the first hour of installation does as much good as six gallons of water three hours later.
2. Depending on the time of year, during periods of little rainfall and high air temperatures, sod and soil must be kept wet for the first 10 days or more after installation. After sod has adhered to your soil, watering can be reduced.
3. When temperatures are 85 degrees F or above, lightly hand water sod and sod bed as it is installed. This will keep grass from wilting until installation is completed, when larger amounts of water can be applied.
CAUTION: Never allow grass to “wilt” and keep traffic off sod during periods of heavy irrigation.
